Product Guaranteed Analysis

Boron (B) 10%

Derived from Boric Acid

Product Tagline (from PTB)

The Solution for Improved Boron Nutrition in Plants

Product Statement (From PTB)

HUMA GRO® BORO-MAX® complexed with Micro Carbon Technology® ensures efficient and effective uptake of boron, which is required for cell division, plant metabolism, cell structure, sugar transport, pollination, and seed development.

General Benefits of Use (from PTB)

- Supplies boron nutrition necessary for metabolic activity, proper growth, and maturation
- Improves quality of crop
- Is required for cell division and normal tissue differentiation and maturation
- Functions with calcium to form an "intercellular cement" to maintain plant structural integrity
- Improves protein metabolism and reduces nitrate accumulation in young leaves
- Enhances pollen viability and pollination in flowering crops
- Improves sugar transport in plants

Deficiencies—When to Apply

- Stubby stem or root growth
- Weakened cell walls that allow crop lodging
- Increase in soluble nitrogen compounds accumulated in young leaves
- Young leaves become chlorotic and die
- Symptoms of calcium deficiency may appear
- CORN: pollen tube failure; COTTON: rosette; NUT CROPS: decreased yields in otherwise healthy trees

Application Instructions

Contents are highly concentrated and must be diluted with water in a ratio of at least 20 parts water to 1 part product prior to foliar application. See table below for specific rate instructions. SHAKE WELL BEFORE USING.

Method of Application	Suggested Rate

Wheat

Huma Gro Applications / Knowledge Base

x [Evaluation of MCT-Based P Fertilizer, Super Phos in Spring Wheat.pdf](#)

General Wheat

The United States is a major wheat-producing country, with output typically exceeded only by China, the European Union, and India.

- Wheat ranks third among U.S. field crops in both planted acreage and gross farm receipts, behind corn and soybeans.
- U.S. wheat harvested area has dropped off nearly 30 million acres, or nearly one-third, from its peak in 1981 because of declining returns compared with other crops and changes in government programs that allow farmers more planting flexibility.
- About half of the U.S. wheat crop is exported.
- Despite rising global wheat trade, the U.S. share of the world wheat market has eroded in the past two decades.

Extention publication on wheat quality
<https://extension.umaine.edu/publications/1019e/>

Wheat in Idaho

Idaho is one of the few places in the world where buyers can find several different classes of wheat in one place. Wheat class is determined by kernel hardness and color, and by its planting time. Each class of wheat has its own characteristics related to milling, baking and agronomic needs.

Soft White Wheat (winter and spring): pastries, pancakes, cakes, cookies, crackers, flat breads, snack foods and cereals.

Hard Red Wheat (winter and spring): yeast breads, hard rolls and bagels, Asian noodles, flat breads.

Hard White Wheat (winter and spring): blended flours, Asian noodles, steam breads, domestic foods made with whole wheat.

Durum: pasta

Idaho wheat production is usually about 100 million bushels/year.
